

SKYFOX DRINKING WATER INNOVATIONS

Introduction

SkyFox explores innovative solutions to support communities to access safe drinking water, while providing cutting-edge solutions for water utilities and other service providers to boost their efficiency.

How we do it

Provision of infrastructure

We provide drinking water infrastructure in rural, small-town and peri-urban communities, including bore-hole drilling and installation of handpumps. We provide water source mechanization for small-town piped schemes, as well as we facilitate access to financing for water supply schemes.

Facilitation of supply

We support Communities, Area Mechanics and water supply service providers to order spare parts through our e-Spare Parts system, a SkyFox mobile phone application, and for suppliers to also respond to demand through the same system.

Monitoring of systems

The SkyFox e-Spare Parts app also enables communities to report breakdown of water systems to their service providers using an interactive menu and report functionality status of pumps as well.

Assessments

SkyFox also undertakes hydro-geological assessments to help service providers to make informed decisions.

Working with Utilities

SkyFox also works with Utility Companies to set up systems to allow self-billing by customers to reduce cost of billing and promote efficiency in tariff collection, while helping customers to report illegal connections, theft, and leakages in pipelines.

Where we do it

SkyFox Limited has been implementing this initiative in Ghana, Guinea, Sierra Leone and Burkina Faso since 2017 and working to extend to Liberia, Cote d'Ivoire and Nigeria soon.
